RESEARCH INTERESTS

Cross-device computing

Users today own multiple computing devices, so cross-device computing between personal devices has drawn much attention. In general, techniques for cross-device computing pose a platform dependency problem. I have conducted research that addresses the dependency problem by exploiting the meta-platform characteristics of web applications.

On-device machine learning

With the increasing popularity of mobile applications employing DNN models, the techniques for efficiently and accurately running the models on mobile devices become important. Specifically, I have researched super-resolution for mobile 360-degree video live streaming and runtime gaze tracking on mobile devices.

Energy-aware mobile systems

Reducing energy consumption has long been a critical issue for mobile devices. I have participated in research on energy optimization for native, web, and game applications on mobile devices. I am also interested in energy-aware on-device machine learning and machine learning-based energy optimization.
