RESEARCH INTERESTS

On-device artificial intelligence

As mobile applications increasingly utilize deep neural network (DNN) models, efficient and accurate execution of the models becomes crucial. My research has specifically focused on super-resolution techniques for mobile 360-degree video live streaming using multi-exit neural networks [c6] and real-time gaze tracking on mobile devices [c3].

Energy-aware mobile systems

Reducing energy consumption has consistently been a crucial concern for mobile devices. I have participated in research on energy optimization for native [c1], web [c2], and game applications [j1] on smartphones. Additionally, I am interested in energy-aware on-device machine learning and machine learning-based energy optimization strategies.

Cross-device computing

With the growing prevalence of multiple personal computing devices, cross-device computing has garnered significant attention. However, existing techniques often face challenges related to platform dependency. My research has addressed this issue by leveraging the meta-platform characteristics in web applications [c5, c7].
